Country Challenge
Indonesia (population 250 million) has struggled to keep up with electricity demand and has underutilized its geothermal energy potential. Geothermal resources are ideally located on islands with major population centers with power supply shortages; however, the country lacks experience in developing these resources.

Project Goals
The project helps finance the confirmation of geothermal resources and construction of a steam field system and 2 powers plants with a total capacity of 150 MW. This capacity would have been developed with domestically abundant coal; thus, the projects reduces emissions and helps demonstrate the potential for scale-up in geothermal projects.
